Partnering neuroscience discoveries

ALS research assets | Partnering discussion

ALS licensing opportunity

ALS AL-series small molecule drugs

Preferred deal paths

Evaluation option, field/territory licensing, or co-development

Scientific lead: Partnering contact

Kou-Juey (K.J.) Wu, MD, PhD | Founder & CSO, Pharwar Pharmaceuticals

Email: kjwu0214@gmail.com | wukj@cgmh.org.tw

Why partner with Pharwar?

Existing exploratory research across complementary preclinical readouts

ALS translational evidence

Motor performance, grip strength, EMG, ChAT, patient-derived iPSC and mouse survival

Stage and limitations

Preclinical findings only; independent replication, PK/PD, safety and development diligence remain ; clinical efficacy claims pending

Opportunity | ALS AL-series

Small-molecule candidates explored in ALS disease models

In vivo functional observations (Fig. 1)

Rotarod and ChAT motor-neuron marker in ALS mice

Biological and translational readouts (Fig. 2)

Grip strength and EMG readouts in ALS mice

iPSC and survival observations (Fig. 3)

Patient-derived iPSC neurite observations and mouse survival curves in ALS mice

Recovery biomarker (data available upon request)

Increased Neurofilament light chain (Nfl) staining in tissue and decreased plasma Nfl levels of ALS mice after treatment

Development status

Exploratory preclinical; clinical efficacy claims pending (data available upon request)

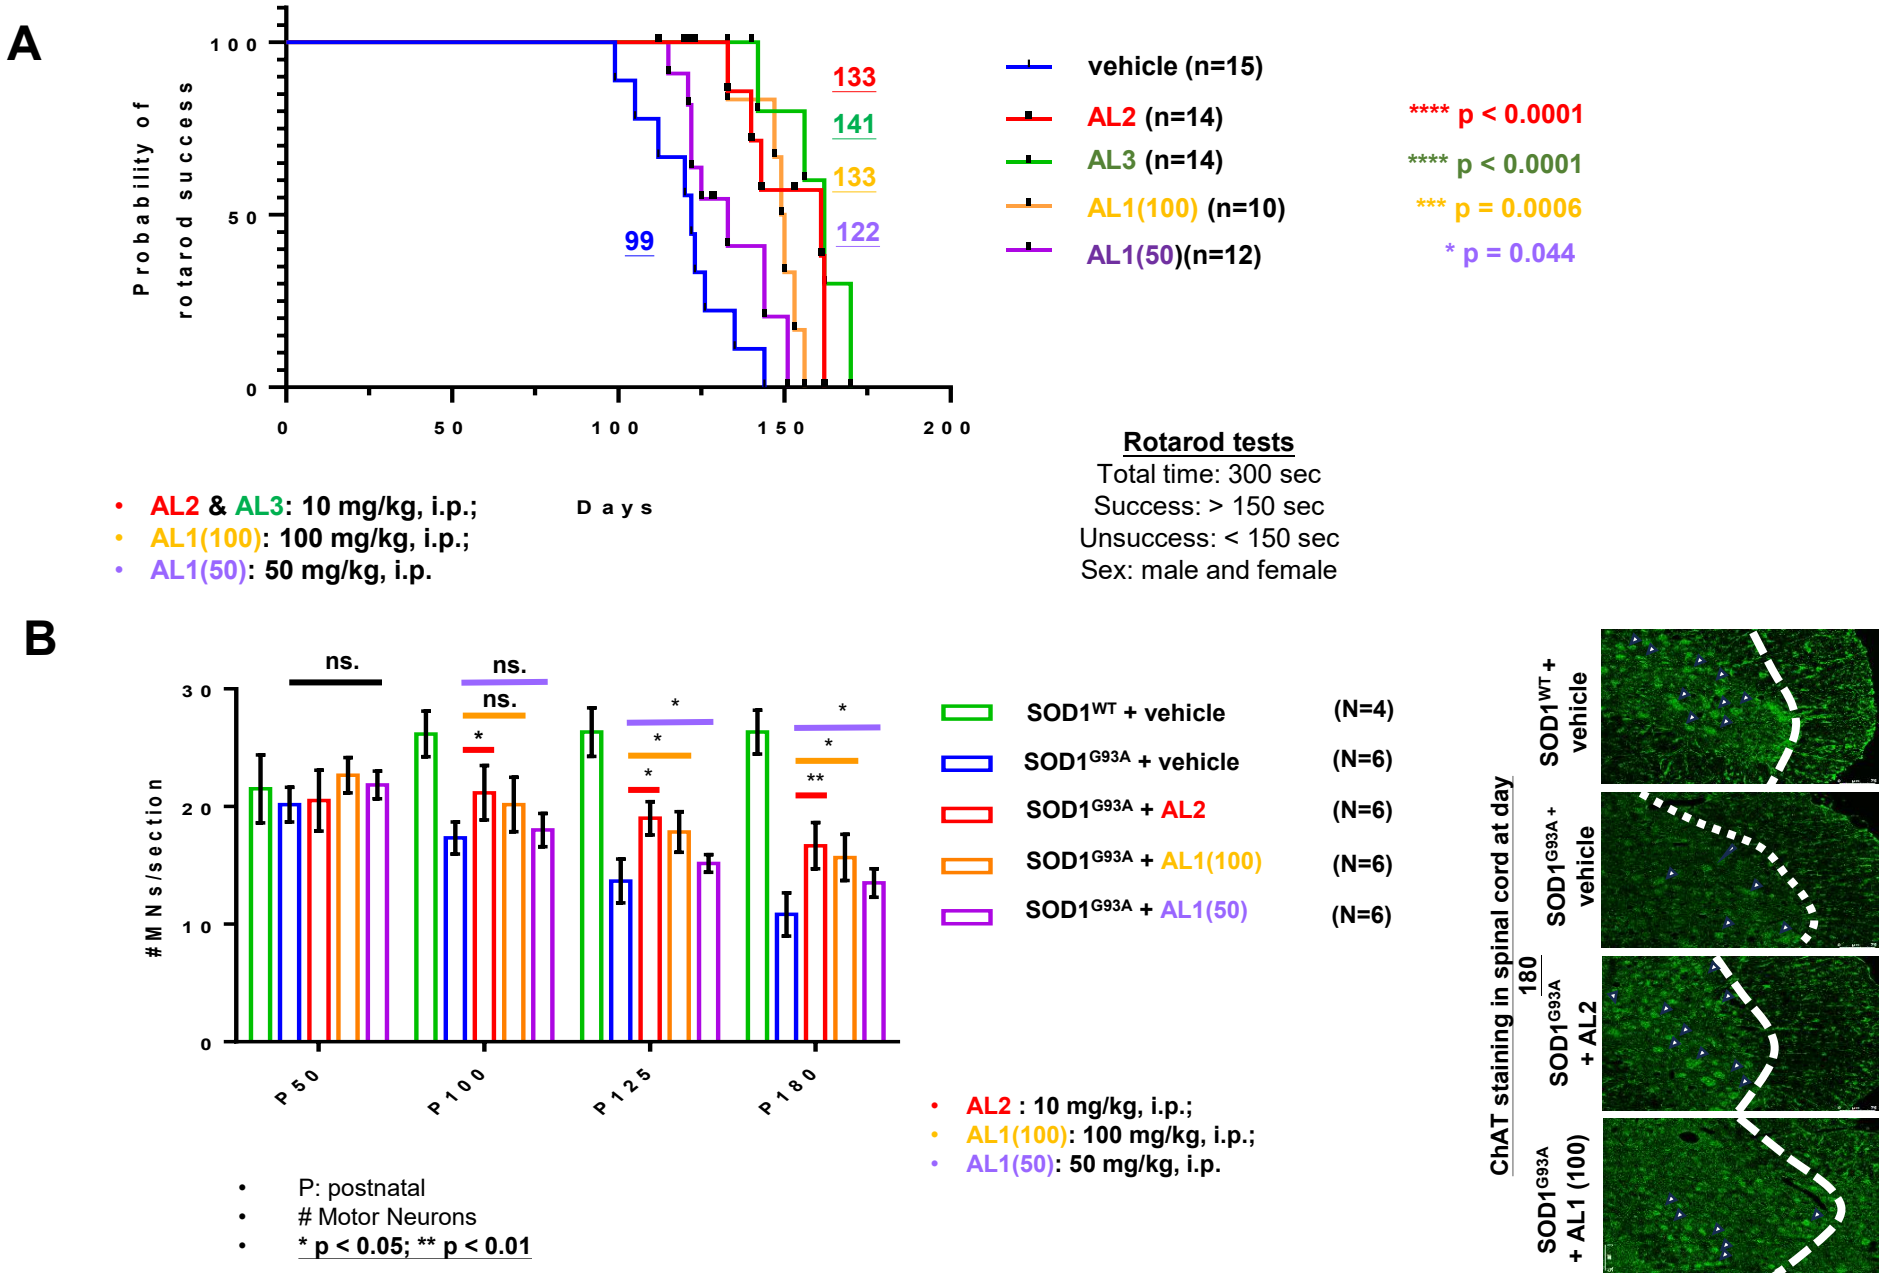

Fig. 1. (A) Treatment of ALS SOD1^{G93A} mutant mice with AL series drugs improved the Rotarod test, (B) Treatment of ALS SOD1^{G93A} mutant mice with AL series drugs increased the ChAT staining.

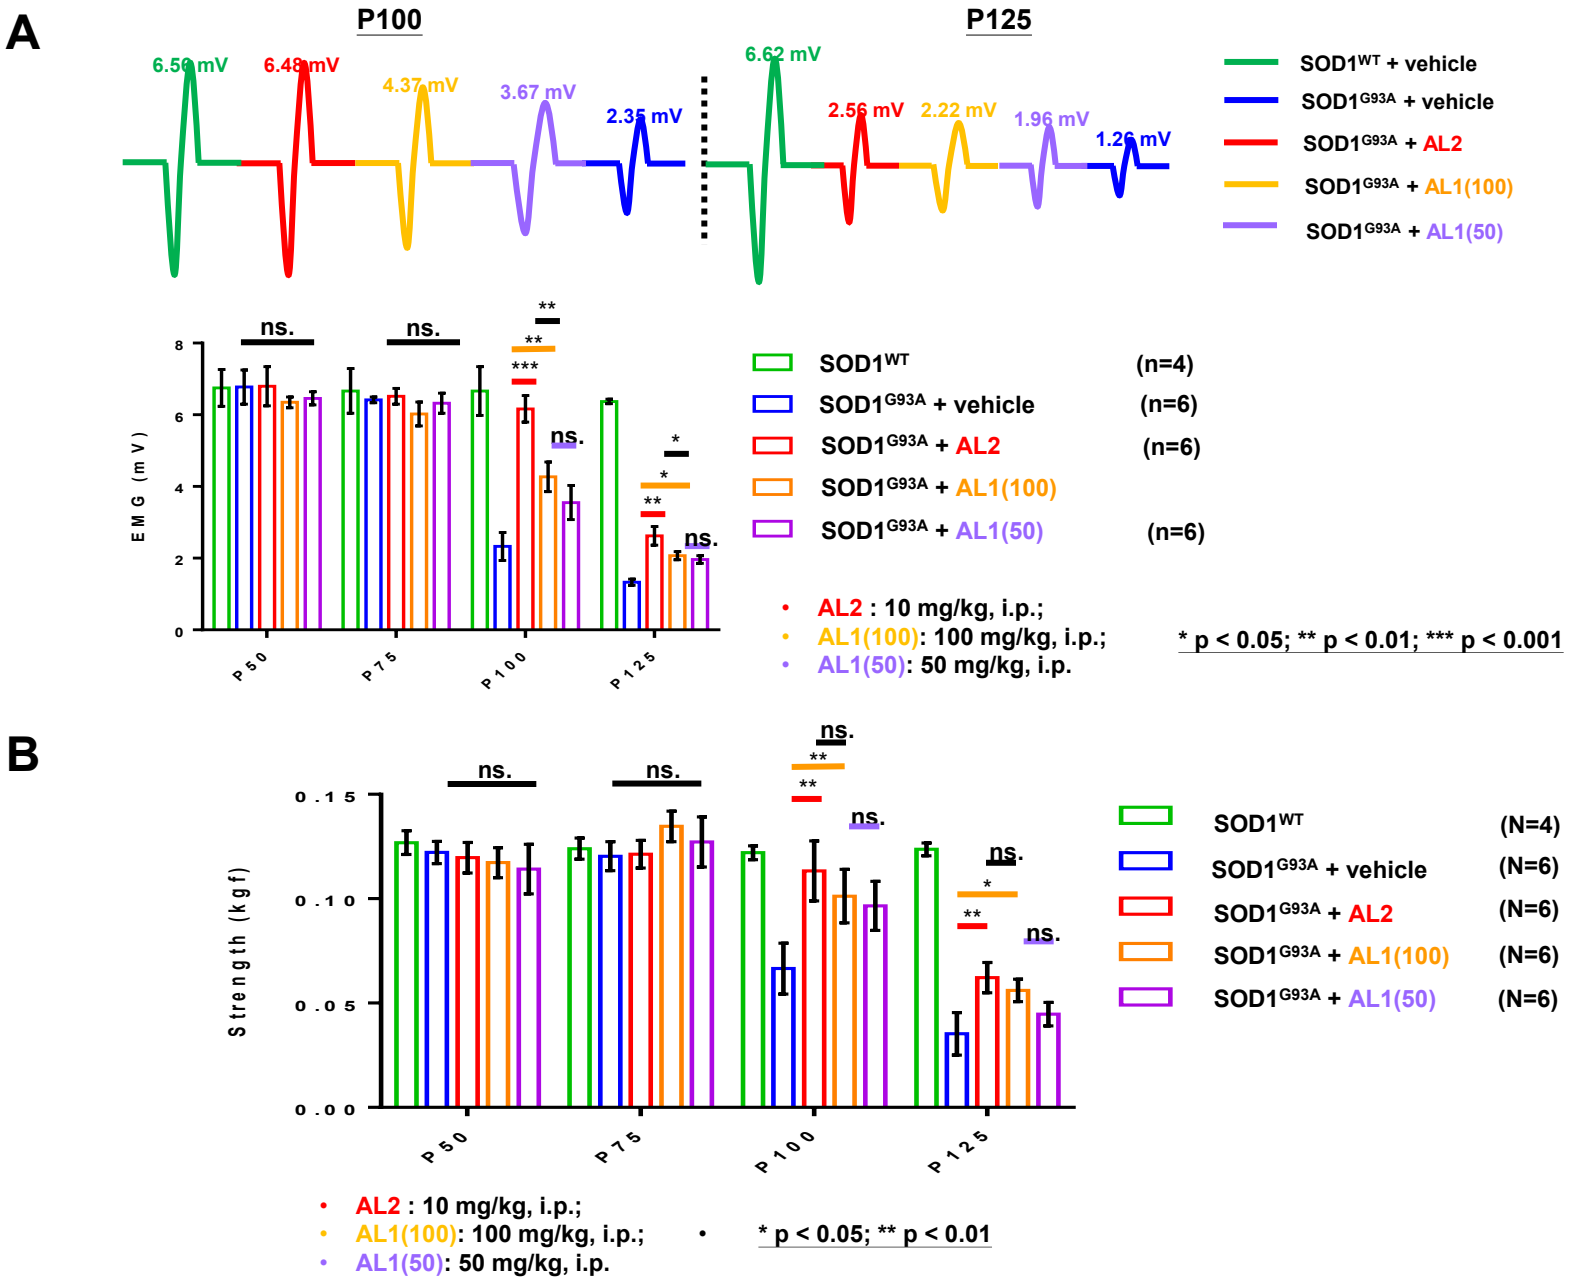

Fig. 2. (A) Treatment of ALS SOD1^{G93A} mutant mice with AL series drugs improved the EMG test, (B) Treatment of ALS SOD1^{G93A} mutant mice with AL series drugs increased the muscle strength.

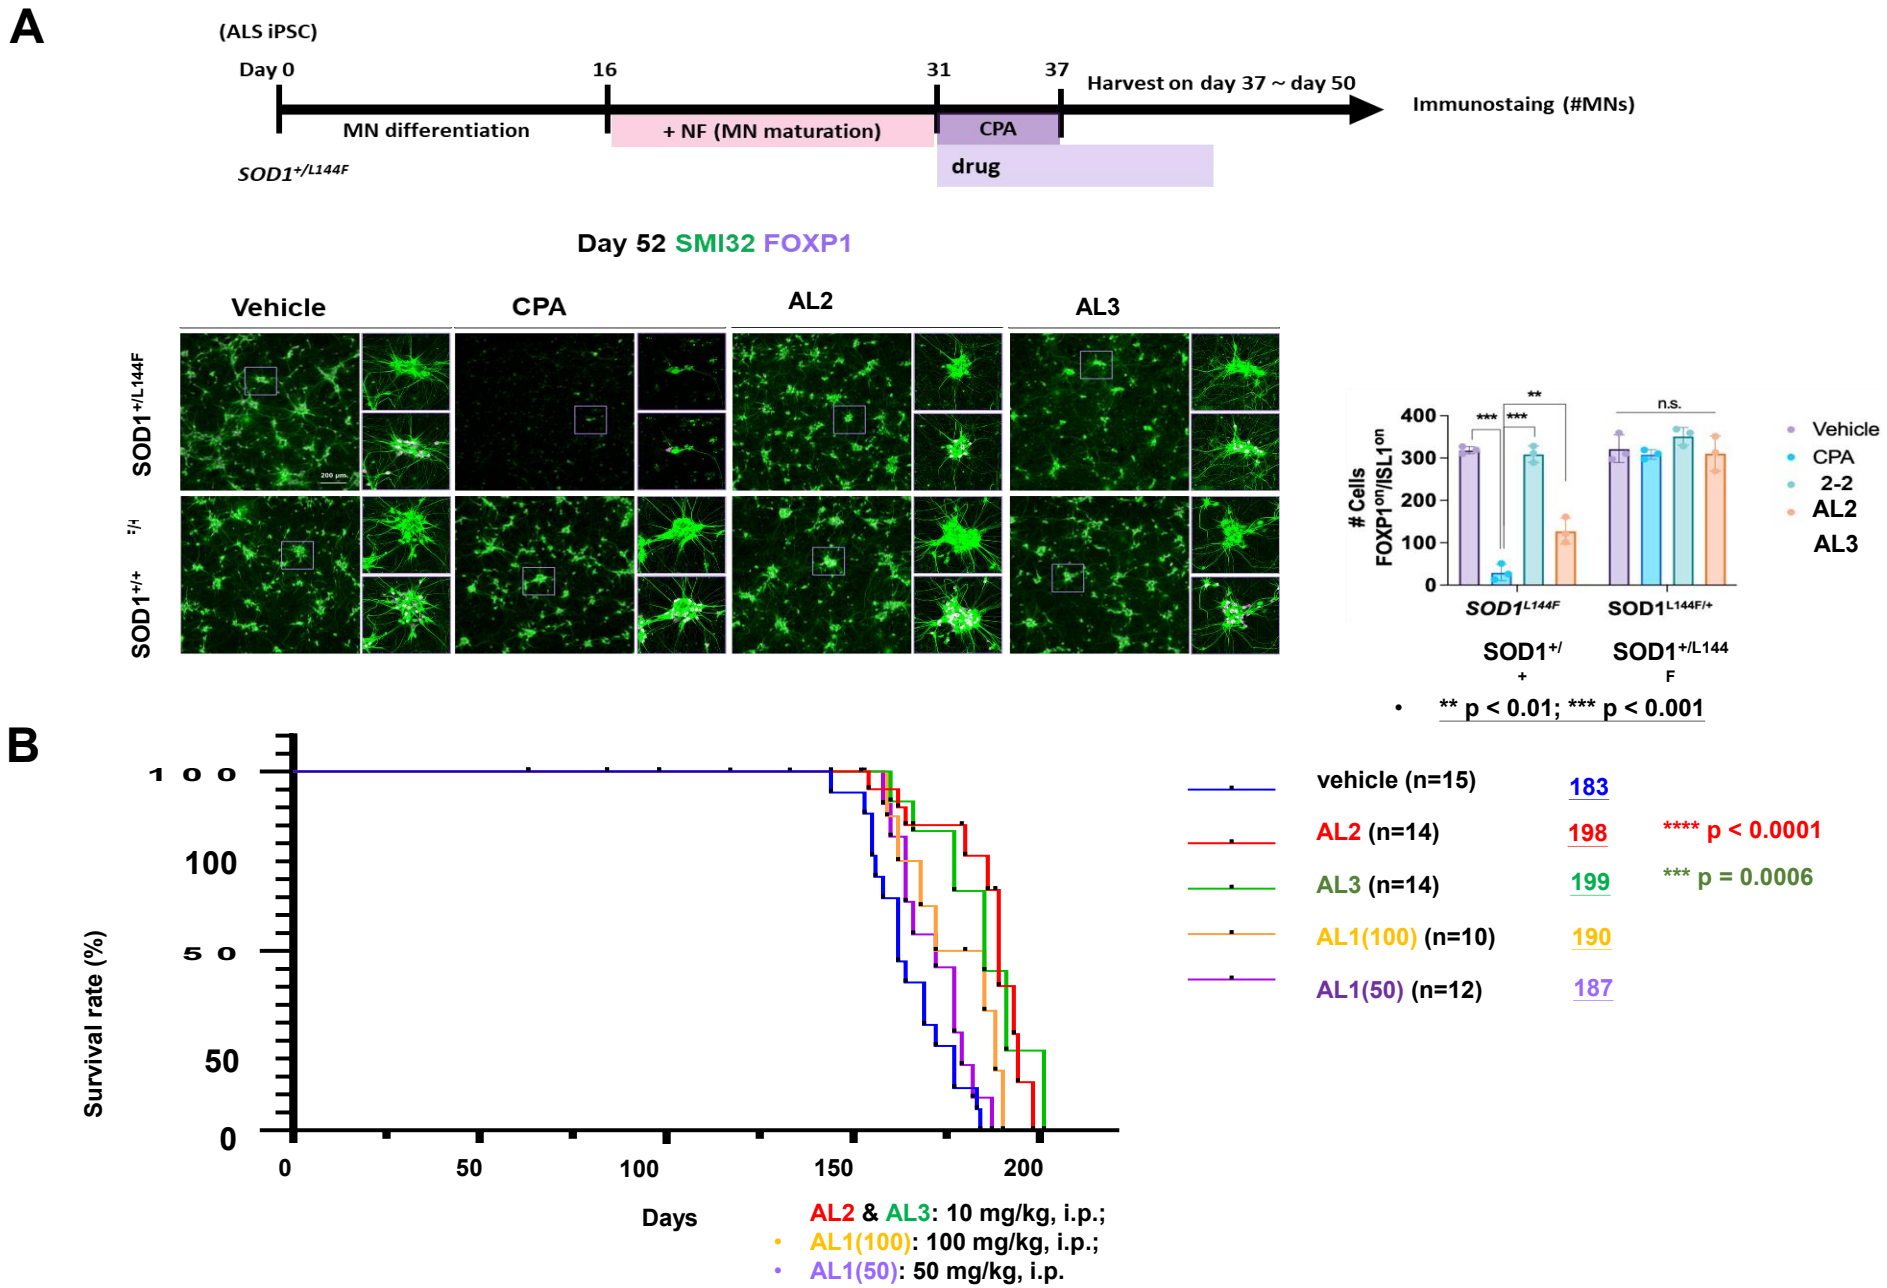

Fig. 3. (A) AL series drugs could promote dendrite formation in iPSC rescues tests using iPSC from ALS patients, (B) Treatment of ALS SOD1^{G93A} mutant mice with AL series drugs increased the life span.

ALS | Evidence and diligence

Original ALS presentation: pp. 4-6

Data shown under CDA

Raw datasets, sample sizes, and statistics (including clinical efficacy upon request)

Critical next experiments

Independent replication, dose exposure, selectivity, PK/PD, tolerability and developability | clinical efficacy

IP landscape

ALS patent application

PCT/CN2025/081059 (showed clinical applicability by European patent office)

Individual country patent applications to be filed before May, 2027

ALS patent fully licensing capability by Pharwar for licensing and/or co-development

Flexible transaction structures

Evaluation agreement
Time-limited, paid evaluation with predefined deliverables and data access

Exclusive option
Option fee, defined field/territory, decision date and exercise terms

Licensing or co-development
Upfront payment, development milestones, royalties and development obligations

Sponsored research
Partner funds narrowly defined validation studies

Partner profile | the workstream

Target groups

ALS track

Neurology and neurodegeneration BD / search-and-evaluation teams

Cross-cutting

Preclinical-focused biotech, translational funds, specialized partnering intermediaries

Prioritization filter

Active relevant pipeline + external partnering remit + funding + clear scientific fit

Path to a partnering discussion

Non-confidential program overview and initial scientific fit

Mutual confidentiality agreement

Confirm IP rights, data package, and development gaps

Discuss evaluation, option, license or co-development terms
